Overview

- What is CODAIT?
- An overview of the Data Asset eXchange (DAX)
- A deep dive into Elyra and its features
- Demo showcasing DAX & Elyra
- How to get involved

CODAIT

Open Source @ IBM

- CODAIT aims to make AI solutions dramatically easier to create, deploy, and manage in the enterprise.
- We contribute to and advocate for the open-source technologies that are foundational to IBM's AI offerings.
- 30+ open-source developers!

Improving the Enterprise AI Lifecycle in Open Source

Data Asset eXchange

Data Asset Exchange offers high-quality datasets with clearly-defined open data licenses in standardized formats, according to IBM.

- Vetted data.
- Exclusive access to IBM Research datasets that have been used in creating popular AI products like [Debater](#) System, Entity Recognition, and so on.
- Datasets with open data licenses for both business applications and advancing core science.
- Packaged with tutorials that shows how to read and analyze data. As well as, train machine or deep learning models on IBM Cloud using IBM Cloud AI services as well as multi-cloud AI open-sourced tools.

| Feature | Description |
|------------------------------|---|
| images | JSON field containing a list of images and their metadata (size, ID, name) |
| annotations | Each object instance annotation contains a series of fields, including the category id and segmentation mask of the object. |
| annotations -> segmentations | Contains the polygon coordinates for the segmentation mask for the specific class instance (table, list, text etc) |
| annotations -> bbox | Contains the bounding box coordinates for the specific class instance (table, list, text etc). |
| annotations -> is_crowd | This field indicates whether the class instance is a single object (is_crowd=0) or multiple objects (is_crowd=1). In this dataset we only have single objects so this field is always set to 0. |
| annotations -> category_id | The class label for the current class instance. This indicates what the current bbox/segmentation mask encapsulates (table, list, text etc). |
| categories | JSON field containing a list of classes and their metadata (ID, name) This dataset has 5 categories (w/ corresponding "ids") - text ("1"), title ("2"), list ("3"), table ("4"), figure ("5"). |

This project includes the NOAA Weather Dataset - JFK Airport (New York) from the Data Asset Exchange and supporting notebooks. The notebooks teach the user to extract, clean and analyze sample weather data and predict weather trends to help airports schedule better flight times. This sample project contains 3 notebooks and 1 CSV file. Please run the notebooks in sequential order of their part numbers using a Python 3.6 runtime.

Info

Access from Cloud Pak for Data

The screenshot shows the IBM Cloud Pak for Data product hub interface. At the top, there's a navigation bar with the IBM logo, a search bar, and links for 'What's new', 'Community', and 'Get support'. Below the header, a 'Table of contents' sidebar is visible, listing various sections like 'Overview', 'Use cases', 'Planning', 'Installing', 'Services and integrations', and 'External data sets'. The 'External data sets' section is expanded, showing sub-sections such as 'Industry accelerators', 'Integrations', 'Administering', 'Analytics projects', 'Accessing data', 'Governing and curating data', 'Integrating and preparing data', 'Analyzing data', 'AI solutions', 'Developer resources', and 'Troubleshooting'. The main content area displays information about 'External data sets', mentioning its partnership with industry leaders to provide access to external reference data. It highlights the 'Weather Company Data Limited Edition' as an offering, detailing its provider ('The Weather Company®'), pricing ('Included with Cloud Pak for Data'), and features ('About this offering'). It also includes sections for 'Use cases' (listing benefits like optimizing operations and reducing costs), 'Industry accelerators' (mentioning manufacturing, retail, and sales), and a 'Get started' section.

IBM Cloud Pak for Data > Services and integrations >

External data sets

Transactional data is central to your business. But if you only analyze your internal transactional data, your analysis is incomplete. Complement your data with external data sets that give you a 360-degree view of your business landscape. The data in the external data sets can help you complete a more comprehensive analysis that can help you make better decisions.

IBM® Cloud Pak for Data has partnered with industry leaders to provide easy and seamless access to external reference data that you can use to enrich your transactional data. Some of the data sets provide historical data, while others provide real-time data.

The data sets make it easy for data scientists to access the data that they need from the same platform where they run build and run their analytic models.

| Data offering | Provided by | Pricing | Learn more |
|--------------------------------------|----------------------|----------------------------------|--|
| Weather Company Data Limited Edition | The Weather Company® | Included with Cloud Pak for Data | <p>About this offering</p> <p>90-day access to cloud-based APIs that enable you to obtain historical weather data, current conditions, and forecast conditions.</p> <p>Use cases</p> <p>You can use weather data to optimize operations, reduce overhead costs, increase safety, and uncover new revenue opportunities. For example, you can:</p> <ul style="list-style-type: none">Predict power outages with greater accuracy so that you can restore power to customers fasterReduce utility costs with smarter vegetation managementImprove flight safety, efficiency and performanceKeep policyholders safe while reducing insurance claims and fraudImprove supply chain visibility and minimize weather-related disruptionsTransport people and goods more safely <p>Industry accelerators</p> <p>The following industry accelerators can help you get started with this data set:</p> <ul style="list-style-type: none">Manufacturing Analytics with WeatherRetail Predictive Analytics with WeatherSales Prediction using The Weather Company Data <p>Get started</p> <p>For details, see https://www.ibm.com/weather.</p> |

Effective Farming - Monitor Crop Growth

28 days ago

The accelerator is created using Data Asset eXchange data to support effective farming by monitoring crop growth using crop guide and provide timely alert to farmers about weather change, possible development of crop disease, evaporation of fungicide, and efficient use of solar panels (agrvoltaics support).

What's included?

- A structured business glossary of 90 business terms.
- Sample data science assets

How does it work?

The glossary provides the information architecture that you need to understand weather related business measures. Your data scientists can use the sample notebooks, predictive models and dashboards to accelerate data preparation, machine learning modeling, and data reporting. Moreover, the data scientists may modify the sample notebooks for other business use cases and corresponding datasets.

Timely alert to farmers can save crop life and bring in more cost savings.

When you import the accelerator:

- The terms are added to your business glossary under the Effective Farming - Monitor Crop Growth category in the Industry Accelerators category.
- The data science assets are added to a new analytics project.

What is Elyra?

Elyra is a set of AI centric extensions to JupyterLab. It aims to help data scientists, machine learning engineers and AI developer's through the model development life cycle complexities.

Elyra on GitHub

<https://github.com/elyra-ai/elyra>

Elyra's Documentation

<https://elyra.readthedocs.io/en/latest/>

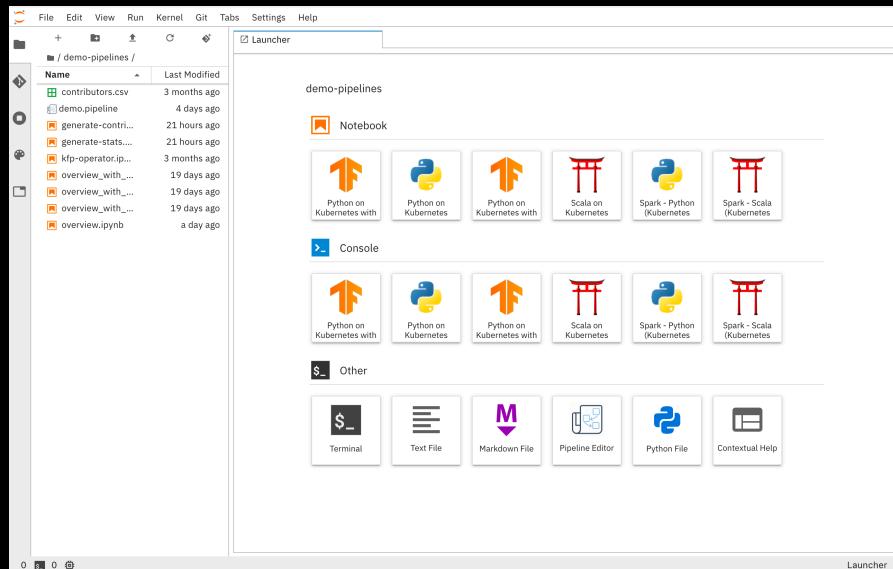

What is Elyra?

Elyra is a set of
AI centric extensions for JupyterLab

Elyra was officially announced as an
open source project by IBM on April
29th.

The name Elyra is a word play with
one of the Jupyter moons “Elara”
where we introduce the “y” from
“Jupyter” to make it “Elyra”

Elyra Core Features

Notebook Pipelines editor

Visual editor for building notebook-based AI pipelines, enabling the conversion of multiple notebooks into batch jobs or workflows.

Notebook as batch jobs

Elyra extends the notebook UI to simplify the submission of notebooks as a batch job for model training

Code Snippets

Easy creation and insertion of reusable code snippets for the various languages

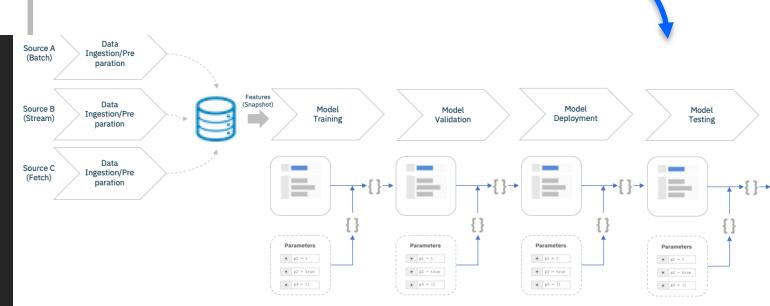

Git integration

Track project changes and share among teammates

Python script execution

Edit and execute python scripts against local or cloud-based resources

Notebook Pipelines

Elyra Core Features

Notebook Pipelines editor

Visual editor for building notebook-based AI pipelines, enabling the conversion of multiple notebooks into batch jobs or workflows.

Notebook as batch jobs

Elyra extends the notebook UI to simplify the submission of notebooks as a batch job for model training

Code Snippets

Easy creation and insertion of reusable code snippets for the various languages

Git integration

Track project changes and share among teammates

Python script execution

Edit and execute python scripts against local or cloud-based resources

Notebook as batch jobs

Elyra Core Features

Notebook Pipelines editor

Visual editor for building notebook-based AI pipelines, enabling the conversion of multiple notebooks into batch jobs or workflows.

Notebook as batch jobs

Elyra extends the notebook UI to simplify the submission of notebooks as a batch job for model training

Code Snippets

Easy creation and insertion of reusable code snippets for the various languages

Git integration

Track project changes and share among teammates

Python script execution

Edit and execute python scripts against local or cloud-based resources

Code Snippets

The screenshot shows the Elyra Code Snippets interface. On the left, there's a sidebar with a tree view containing sections like [CPP] My cpp code, [scala] Spark - Bank Scenario, [Python] Read Environment Variable, [Scala] Spark - Configuration details, and [python] Matplotlib Configuration. The main area has a code editor with Python 3 syntax highlighting. The code in the editor is:

```
[1]: from __future__ import print_function, division
import numpy as np
import matplotlib as mpl
import matplotlib.pyplot as plt
%matplotlib inline

[2]: # Silly example data
bp_x = np.linspace(0, 2*np.pi, num=40, endpoint=True)
bp_y = np.sin(bp_x)

# Make the plot
plt.plot(bp_x, bp_y, linewidth=2, linestyle='--',
         color='blue', label="Legend label sin(x)")
plt.xlabel("Description of x coordinate (units)")
plt.ylabel("Description of y coordinate (units)")
plt.title("Title here (remove for papers)")
plt.xlim(-1.1, 1.1)
plt.ylim(-1.1, 1.1)
plt.legend(loc="lower left")
plt.show()
```

Below the code editor is a plot window showing a blue dashed sine wave. The x-axis is labeled "Description of x coordinate (units)" and ranges from 0 to 6. The y-axis is labeled "Description of y coordinate (units)" and ranges from -1.00 to 1.00. A legend entry "Legend label sin(x)" is present at the bottom left of the plot area.

Elyra Core Features

Notebook Pipelines editor

Visual editor for building notebook-based AI pipelines, enabling the conversion of multiple notebooks into batch jobs or workflows.

Notebook as batch jobs

Elyra extends the notebook UI to simplify the submission of notebooks as a batch job for model training

Code Snippets

Easy creation and insertion of reusable code snippets for the various languages

Git integration

Track project changes and share among teammates

Python script execution

Edit and execute python scripts against local or cloud-based resources

Git integration

```
!pip install PyGithub pandas >/dev/null 2>61
import os
import datetime
import pandas as pd
from github import Github
github = Github(os.environ['GITHUB_TOKEN'])

github_org = github.get_organization('jupyter')
github_repo = github_org.get_repo('enterprise_gateway')
datetime_start = datetime.datetime.now() + datetime.timedelta(days=-180) #datetime.datetime(2018, 7, 1)
(...)

github._http_headers['User-Agent'] = 'Jupyter Enterprise Gateway'
github._http_headers['Accept'] = 'application/vnd.github.v3+json'
github._http_headers['Content-Type'] = 'application/json'

contributions_df.to_csv('community_contributions.csv', index=False)
```

Elyra Core Features

Notebook Pipelines editor

Visual editor for building notebook-based AI pipelines, enabling the conversion of multiple notebooks into batch jobs or workflows.

Notebook as batch jobs

Elyra extends the notebook UI to simplify the submission of notebooks as a batch job for model training

Code Snippets

Easy creation and insertion of reusable code snippets for the various languages

Git integration

Track project changes and share among teammates

Python script execution

Edit and execute python scripts against local or cloud-based resources

Python Script editor

The screenshot shows the Elyra Python Script editor interface. On the left is a file browser with a single file named 'PANDA.py' selected. The main area contains a code editor with the following Python script:

```
1 # Add sample panda code to manipulate the generated df
2 import io
3 import requests
4 import pandas as pd
5 import time
6
7 def delay(seconds):
8     time.sleep(seconds)
9
10 def df_from_url(url):
11     data = requests.get(url).content
12     df = pd.read_csv(io.StringIO(data.decode('utf-8')))
13     return df
14
15 # Uncomment the lines below to sleep for a bit
16 # useful to demonstrate kernel startup on container environments
17 # delay(3)
18
19 # Sample panda code to manipulate the generated data frame
20 # and calculate mean price per zipcode
21 df = df_from_url('http://samplecsvs.s3.amazonaws.com/SacramentoRealEstateTransactions.csv')
22 df.groupby(['zip'])['price'].mean()
```

Below the code editor is a 'Python Console Output' window showing the results of the script execution:

```
1: zip
95603 405590.869000
95608 795084.759000
95610 226436.285714
95614 300000.000000
95619 216033.000000
95838 149461.351351
95841 213806.142857
95842 143281.772727
95843 227000.000000
95864 364400.000000
Name: price, Length: 68, dtype: float64
```

Data Science Process

Data Extraction

Data Cleaning

Data Exploration

Model Development

Result Interpretation

Getting Started

What are the pre-requisites to run?

- NodeJS 12+
- Python 3.X
- Anaconda (optional)
- JupyterLab Support
- JupyterLab 1.X is supported on Elyra 0.10.x and below
- JupyterLab 2.X is supported on Elyra 1.0.0 and above
- KubeFlow Installation (optional)

Install Elyra

To install Elyra:

```
$ pip install elyra==1.1.0 && jupyter lab build Or:
```

```
$ pip install --upgrade elyra && jupyter lab build
```

To verify installation:

```
$ jupyter serverextension list And
```

```
$ jupyter labextension list
```

Starting Elyra:

```
$ jupyter lab
```

Get involved
